

What This Fixes

1 Key Namespacing

Old:

```
s1
```

New:

```
assistant:session:s1
```

No collision ever.

2 Safe Redis Failure

If Redis container:

- Stops
- Crashes
- Network fails

Your assistant:

- Will NOT crash
- Will just behave like new session

This is critical production hardening.

3 Auto TTL Refresh

Every save:

```
ex=TTL_SECONDS
```

So active users never expire mid-session.

4 Docker Ready

If running inside Docker compose:

Set:

```
REDIS_URL=redis://redis:6379/0
```

If running locally:

```
REDIS_URL=redis://localhost:6379/0
```

No code change required.

Step 7 Test Checklist

1

Start Redis Docker

```
docker run -d -p 6379:6379 --name cartcopilot-redis redis:7
```

2

Start assistant service

3

Test

Search → Add → Show cart

Kill Redis container

Search again

Expected:

- No crash
 - Session resets
-

After This

Your architecture is now:

- Stateless FastAPI
- Stateful Redis session
- Proper graph routing
- Production-grade cart logic
- Ambiguity handling
- Multi-quantity support
- Guard enforcement

You are now at **Production-Level Assistant v1.0**.
